

MITIGATING MOOSE COLLISIONS

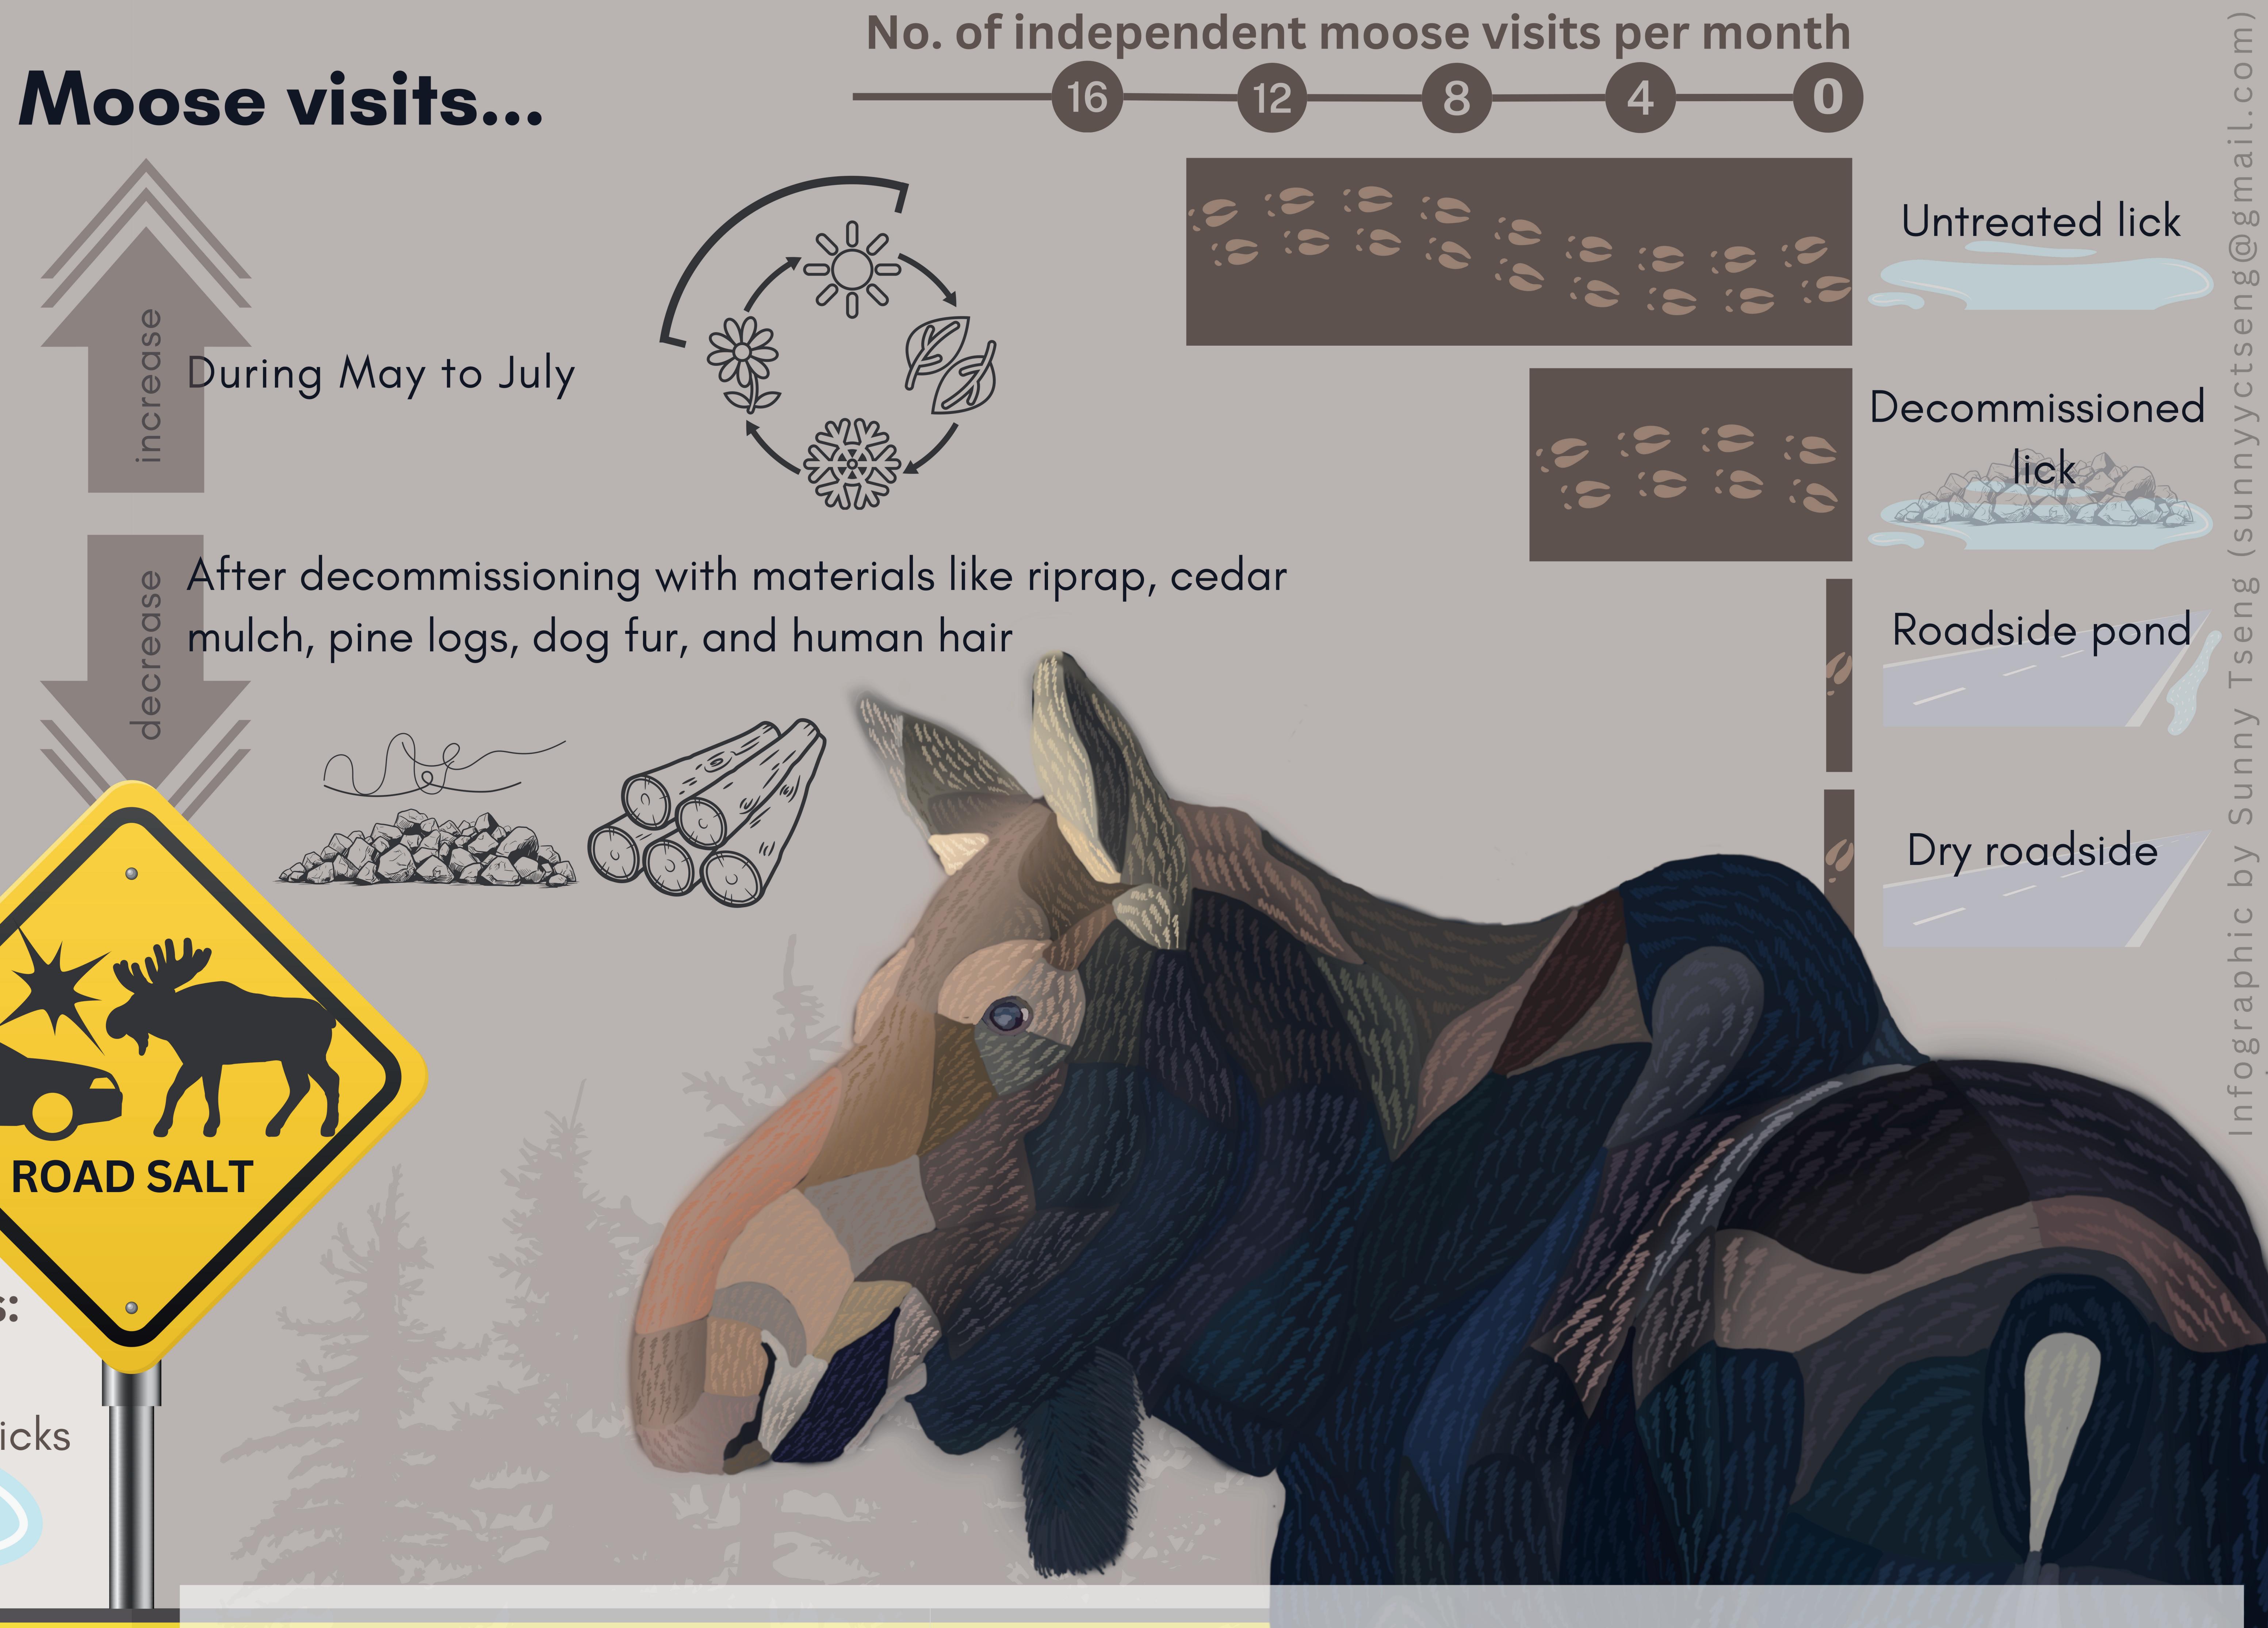

By Decommissioning Roadside Mineral Licks

Roadside mineral licks, formed by winter road salt runoff, lead to moose visitations near highways, contributing to moose-vehicle collisions. The research examines the impact of decommissioning roadside mineral licks with a focus on mitigating moose-vehicle collisions.

wildlife camera sites:

- Untreated licks
 - Decommissioned licks
 - Roadside ponds
 - Dry roadsides

Decommissioning roadside licks is effective at reducing the use of roadside areas by moose and should enhance highway safety in regions with high moose and motorist densities.
